WIZ ULTRA SONIC LEAK DETECTOR

[Call for Pricing](#)

HOW IT WORKS:

The use of a specific frequency of ultra sonic waves which does not travel through metal or glass, but does travel through air, quickly detects body shift fit problems.

IT'S EASY TO USE:

1. Place the transmitter in the vehicle, correct side up and plug into the cigarette lighter.
2. Close all doors and windows.
3. Plug headphones into the receiver probe and put them on.
4. Push the power switch forwards to power the probe receiver.
5. An audible slow "ticking" will be heard.
6. Move the probe receiver around the seals in the suspected area.
7. When the probe receiver picks up the transmitted frequency, the "ticking" will increase in frequency.
8. At the same time the LED on the receiver will change colour.
9. Once the leak has been located, repair and test again.
