## **Induction Heaters**

[Call for Pricing](#)

- \*Heat is generated in the heart of the metal at a depth of 5mm
- \*The Induction heater brings metal to red hot temperature in seconds
- \*No open flame, which allows work to be carried out with no risk of damage to surrounding parts and cables.
- \*Induction enables the metal to be heated with precision in a localised spot, and brings the metal up to ideal temperature.
- \*Straightening, bending and loosening of seized up pieces can all be carried out with the IHR05 Induction Heater
- \*In Opposition to heating with a flame (3000 Degrees Celcius) and inevitably changes its technical characteristics, the induction technique only produces heat at the point of contact and brings the metal almost instantaneously to a uniform temperature of 500-600 Degrees Celcius.
